**Recommended: COMBINE AND REVISE**

The three proposed concepts can be combined because their functionalities are related and can be organized into one integrated system for Highlanders Coffee & Tea. However, the proponents should revise the documentation to clearly identify the **system modules, processes, and relationships between the proposed features**.

The recommended module breakdown is:

1. **User and Role Management** – account creation, login, user roles, and access permissions.
2. **Product and Inventory Management** – product/category management, stock-in/out, inventory adjustments, low-stock monitoring, and inventory history.
3. **Recipe/Ingredient Management** – define the ingredients required for each product so that inventory quantities can be properly deducted when a sale is recorded.
4. **POS and Sales Management** – customer orders, product customization, computation, payment recording, receipts, transaction history, and authorized void/cancellation.
5. **Customer Ordering Module** – digital catalog, cart, product customization, delivery information, checkout, and order placement.
6. **Delivery Management** – order assignment, delivery status updates, delivery personnel management, and completion of orders.
7. **Staff Scheduling and Attendance** – employee schedules, shift assignments, attendance, duty hours, and schedule notifications.
8. **Staff Task Management** – assignment and monitoring of specific duties or tasks assigned to employees.
9. **Promotions and Announcements** – product promotions, discounts, announcements, and scheduled promotional content.
10. **Reports and Dashboard** – sales, inventory, delivery, attendance, duty hours, and other management summaries.

The proponents should also add the following requirements that are currently not sufficiently defined in the documentation: **recipe/ingredient management, stock movement history, inventory audit trail, product availability control, shift conflict validation, staff task monitoring, scheduled promotions, order cancellation/void rules, and centralized notifications**.

The documentation should also be revised to ensure that the **Project Objectives, Major Features, Scope and Limitations, Functional Requirements, and Non-Functional Requirements are consistent with one another**. Every major feature listed should have a corresponding functional requirement, while features that are not intended for the initial system should be clearly placed under the limitations.

Avoid using vague terms such as **“inventory sorting”** when the intended function is actual inventory control. Use **“Inventory Management and Stock Monitoring”** instead. The

proponents should also clearly define the delivery coverage, payment methods, attendance-recording process, user roles, and order-status flow.

**Overall Recommendation:** The combined concept is acceptable for the requirements analysis activity, provided that the proponents revise the documentation according to the module breakdown above and ensure that the requirements are specific, measurable, and consistent across all sections.
